The powerful, easy-to-use JavaScript testing framework.

[Get Started](#) [View the Docs](#)

Easy

Zero configuration and setup for any Node.js project, and minimal setup for Browser-based projects.

Universal

QUnit can run anywhere; web browsers, Node, SpiderMonkey, even in a Web Worker! Test your code where it runs.

Extensible

Flexible APIs for custom assertions, runners, and reporters mean you can extend QUnit to fit your needs.

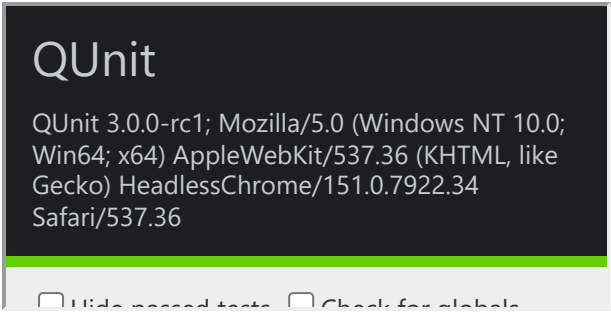

A Quick Example

```
function add (a, b) {
  return a + b;
}

QUnit.module('add', (hooks) => {
  QUnit.test('two numbers', (assert) => {
    assert.equal(add(1, 2), 3);
  });
});
```

```
});  
});
```

Browser Result

CLI Result

```
TAP version 13  
ok 1 add > two numbers  
1..1  
# pass 1  
# skip 0  
# todo 0  
# fail 0
```
